RULES AND PROCEDURES OF THE YANG MILLS GROUP

The purpose of this group is to evaluate OpenAI's claimed construction of YM theory in four dimensions and QCD and release it along with an assessment. The assessment will include a clear statement of what is claimed, our understanding of the ideas behind the proof and our judgment as to whether the proof is correct, as well as a careful review of the work of the many researchers whose work went into these results. This group may extend its purview to review other works submitted to it.

This group will be led by a steering committee consisting of:

Michael Douglas
David Gross (Chair)
Arthur Jaffe
Igor Klebanov
Nikita Nekrasov

whose decisions will determine how we proceed and when we release the LLM products.

We intend to add additional members to help with specific tasks. We will be transparent about the membership of our collaborations. Participants will not be asked to sign nondisclosure agreements but will agree to abide by the decisions of the steering committee. Participation is voluntary and unpaid.

We do not seek academic credit for the discoveries produced by AI models. The group should receive recognition for the understanding they develop; the write-ups they author and the other materials they create. The group will also help ensure that the work appropriately credits the researchers, techniques, and ideas that it draws on.

Members of the group must avoid conflicts of interest as well as the appearance of such and must disclose potential conflicts. Conflicts include doing research outside of the group on the problems we are reviewing (proofs of the existence of Yang-Mills and QCD), working for a company which is doing such research, or anything which might interfere with an unbiased evaluation.

Members are free to leave the group, in which case they agree not to disclose any materials provided to them by the group or work developed by the group.
